

DOSEman Mining Edition

To know quickly what's going on!

Is the Radon concentration in the working area lower or higher than the limit?
Is the mine ventilation properly working?
Can I enter the adits, shafts, tunnels?

The answers are provided by the Radon instrument DOSEman!

The DOSEman has been developed within a project of the German Federal Office of Radiation Protection. The small size, the light weight and its rugged design allow the usage in underground mines and permanent wearing. Miners and mining companies around the world trust the DOSEman – since more than 15 years!

The unit works 12 days by battery and can be operated by a single push button.

Real alpha spectroscopy ensures a minimum response time. Measured radon concentrations as well as the alpha spectrum are stored for preservation of evidence and may be read through an infra-red interface.
